#### Abstract

Our purpose is to introduce the concept of almost ( $\Lambda, s p$ )-continuous multifunctions. In particular, we investigate some characterizations of almost ( $\Lambda, s p$ )-continuous multifunctions.

## 1 Introduction

In 1968, Singal and Singal [6] introduced and studied the notion of almost continuous functions. In 1982, Popa [5] extended the concept of almost continuous functions to multifunctions and introduced the notions of upper and lower continuous multifunctions. In 1983, Abd El-Monsef et al. [1] introduced a weak form of open sets called $\beta$-open sets. In 2004, Noiri and Hatir [4] defined $\Lambda_{s p}$-sets in terms of the concept of $\beta$-open sets and investigated the notion of $\Lambda_{s p}$-closed sets by using $\Lambda_{s p}$-sets. Boonpok [2] introduced the concepts of $(\Lambda, s p)$-closed sets and $(\Lambda, s p)$-open sets which are defined by utilizing the notions of $\Lambda_{s p}$-sets and $\beta$-closed sets. The purpose of the present paper is to introduce the notion of almost $(\Lambda, s p)$-continuous multifunctions. Moreover, we discuss several characterizations of almost ( $\Lambda, s p$ )-continuous multifunctions.

Key words and phrases: $(\Lambda, s p)$-open set, almost $(\Lambda, s p)$-continuous multifunction.

## 2 Preliminaries

Throughout this paper, spaces $(X, \tau)$ and $(Y, \sigma)$ (or simply $X$ and $Y$ ) always mean topological spaces on which no separation axioms are assumed unless explicitly stated. Let $A$ be a subset of a topological space $(X, \tau)$. The closure of $A$ and the interior of $A$ are denoted by $\mathrm{Cl}(A)$ and $\operatorname{Int}(A)$, respectively. A subset $A$ of a topological space $(X, \tau)$ is called $\beta$-open [1] if $A \subseteq \mathrm{Cl}(\operatorname{Int}(\mathrm{Cl}(A)))$. The complement of a $\beta$-open set is called $\beta$-closed. The family of all $\beta$-open sets of a topological space $(X, \tau)$ is denoted by $\beta(X, \tau)$. A subset $\Lambda_{s p}(A)$ [4] is defined as follows:

$$
\Lambda_{s p}(A)=\cap\{U \mid A \subseteq U, U \in \beta(X, \tau)\}
$$

A subset $A$ of a topological space $(X, \tau)$ is called a $\Lambda_{s p}-s e t[4]$ if $A=\Lambda_{s p}(A)$. A subset $A$ of a topological space $(X, \tau)$ is said to be $(\Lambda, s p)$-closed [2] if $A=T \cap C$, where $T$ is a $\Lambda_{s p}$-set and $C$ is a $\beta$-closed set. The complement of a $(\Lambda, s p)$-closed set is called $(\Lambda, s p)$-open. Let $A$ be a subset of a topological space $(X, \tau)$. A point $x \in X$ is called a $(\Lambda, s p)$-cluster point [2] of $A$ if $A \cap U \neq \emptyset$ for every ( $\Lambda, s p$ )-open set $U$ of $X$ containing $x$. The set of all ( $\Lambda, s p$ )-cluster points of $A$ is called the ( $\Lambda, s p$ )-closure [2] of $A$ and is denoted by $A^{(\Lambda, s p)}$. The union of all $(\Lambda, s p)$-open sets contained in $A$ is called the $(\Lambda, s p)$-interior [2] of $A$ and is denoted by $A_{(\Lambda, s p)}$.

By a multifunction $F:(X, \tau) \rightarrow(Y, \sigma)$, following [3], we shall denote the upper and lower inverse of a set $B$ of $Y$ by $F^{+}(B)$ and $F^{-}(B)$, respectively, that is, $F^{+}(B)=\{x \in X \mid F(x) \subseteq B\}$ and

$$
F^{-}(B)=\{x \in X \mid F(x) \cap B \neq \emptyset\} .
$$

In particular, $F^{-}(y)=\{x \in X \mid y \in F(x)\}$ for each point $y \in Y$ and for each $A \subseteq X, F(A)=\cup_{x \in A} F(x)$. Let $\mathcal{P}(Y)$ be the collection of all nonempty subsets of $Y$. For any $(\Lambda, s p)$-open set $V$ of a topological space $(Y, \sigma)$, we denote $V^{+}=\{B \in \mathcal{P}(Y) \mid B \subseteq V\}$ and $V^{-}=\{B \in \mathcal{P}(Y) \mid B \cap V \neq \emptyset\}$.

## 3 Almost $(\Lambda, s p)$-continuous multifunctions

In this section, we introduce the notion of almost $(\Lambda, s p)$-continuous multifunctions. Moreover, we discuss several characterizations of almost ( $\Lambda, s p$ )continuous multifunctions.

Definition 3.1. A multifunction $F:(X, \tau) \rightarrow(Y, \sigma)$ is said to be almost ( $\Lambda, s p$ )-continuous if, for each $x \in X$ and each $(\Lambda, s p)$-open sets $V_{1}, V_{2}$ of $Y$
such that $F(x) \in V_{1}^{+} \cap V_{2}^{-}$, there exists a $(\Lambda, s p)$-open set $U$ of $X$ containing $x$ such that $F(U) \subseteq\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}$ and $F(z) \cap\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)} \neq \emptyset$ for every $z \in U$.

Theorem 3.2. For a multifunction $F:(X, \tau) \rightarrow(Y, \sigma)$, the following properties are equivalent:
(1) $F$ is almost $(\Lambda, s p)$-continuous;
$F^{+}\left(V_{1}\right) \cap F^{-}\left(V_{2}\right) \subseteq\left[F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)}$ for every $(\Lambda, s p)$-open sets $V_{1}, V_{2}$ of $Y$;
$\left[F^{-}\left(\left[\left[K_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{+}\left(\left[\left[K_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)} \subseteq F^{-}\left(K_{1}\right) \cup F^{+}\left(K_{2}\right)$ for every $(\Lambda, s p)$-closed sets $K_{1}, K_{2}$ of $Y$;
(4)

$$
\begin{aligned}
& {\left[F^{-}\left(\left[\left[B_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{+}\left(\left[\left[B_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}} \\
& \subseteq F^{-}\left(B_{1}^{(\Lambda, s p)}\right) \cup F^{+}\left(B_{2}^{(\Lambda, s p)}\right)
\end{aligned}
$$

for every subsets $B_{1}, B_{2}$ of $Y$;

$$
\begin{align*}
& F^{+}\left(\left[B_{1}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[B_{2}\right]_{(\Lambda, s p)}\right)  \tag{5}\\
& \subseteq\left[F^{+}\left(\left[\left[\left[B_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[\left[\left[B_{2}\right]_{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]_{(\Lambda, s p)}
\end{align*}
$$

for every subsets $B_{1}, B_{2}$ of $Y$.
Proof. (1) $\Rightarrow(2)$ : Let $V_{1}, V_{2}$ be any $(\Lambda, s p)$-open sets of $Y$ such that

$$
x \in F^{+}\left(V_{1}\right) \cap F^{-}\left(V_{2}\right) .
$$

Then, $F(x) \in V_{1}^{+} \cap V_{2}^{-}$and hence there exists a $(\Lambda, s p)$-open set $U$ of $X$ containing $x$ such that $F(U) \subseteq\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}$ and $F(z) \cap\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)} \neq \emptyset$ for each $z \in U$. Thus, $U \subseteq F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)$ and hence

$$
x \in\left[F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)} .
$$

Therefore, $F^{+}\left(V_{1}\right) \cap F^{-}\left(V_{2}\right) \subseteq\left[F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)}$.
$(2) \Rightarrow(3)$ : Let $K_{1}, K_{2}$ be any $(\Lambda, s p)$-closed sets of $Y$. Then, $Y-K_{1}$ and $Y-K_{2}$ are $(\Lambda, s p)$-open sets of $Y$, by (2),

$$
\begin{aligned}
& X-\left[F^{-}\left(K_{1}\right) \cup F^{+}\left(K_{2}\right)\right] \\
& =F^{+}\left(Y-K_{1}\right) \cap F^{-}\left(Y-K_{2}\right) \\
& \subseteq\left[F^{+}\left(\left[\left[Y-K_{1}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[\left[Y-K_{2}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)} \\
& =\left[\left(X-F^{-}\left(\left[\left[K_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cap\left(X-F^{+}\left(\left[\left[K_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)}\right.\right. \\
& =X-\left[F^{-}\left(\left[\left[K_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{+}\left(\left[\left[K_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}
\end{aligned}
$$

and hence
$\left[F^{-}\left(\left[\left[K_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{+}\left(\left[\left[K_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)} \subseteq F^{-}\left(K_{1}\right) \cup F^{+}\left(K_{2}\right)$.
$(3) \Rightarrow(4)$ : Let $B_{1}, B_{2}$ be any subsets of $Y$. Then, $B_{1}^{(\Lambda, s p)}$ and $B_{2}^{(\Lambda, s p)}$ are $(\Lambda, s p)$-closed in $Y$, by (3),

$$
\begin{aligned}
& {\left[F^{-}\left(\left[\left[B_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{+}\left(\left[\left[B_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)]}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}} \\
& \subseteq F^{-}\left(B_{1}^{(\Lambda, s p)}\right) \cup F^{+}\left(B_{2}^{(\Lambda, s p)}\right) .
\end{aligned}
$$

$(4) \Rightarrow(5)$ : Let $B_{1}, B_{2}$ be any subsets of $Y$. Thus, by (4),
$F^{-}\left(\left[B_{1}\right]_{(\Lambda, s p)}\right) \cap F^{+}\left(\left[B_{2}\right]_{(\Lambda, s p)}\right)$
$=X-\left[F^{+}\left(\left[Y-B_{1}\right]^{(\Lambda, s p)}\right) \cup F^{-}\left(\left[Y-B_{2}\right]^{(\Lambda, s p)}\right)\right]$
$\subseteq X-\left[F^{+}\left(\left[\left[\left[Y-B_{1}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right) \cup F^{-}\left(\left[\left[\left[Y-B_{2}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}$
$=X-\left[F^{+}\left(Y-\left[\left[\left[B_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cup F^{-}\left(Y-\left[\left[\left[B_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}$
$=X-\left[\left(X-F^{-}\left(\left[\left[\left[B_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cup\left(X-F^{+}\left(\left[\left[\left[B_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]^{(\Lambda, s p)}\right.\right.$
$=\left[F^{-}\left(\left[\left[\left[B_{1}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{+}\left(\left[\left[\left[B_{2}\right]_{(\Lambda, s p)}\right]^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)}$.
$(5) \Rightarrow(2)$ : The proof is obvious.
$(2) \Rightarrow(1)$ : Let $V_{1}, V_{2}$ be any $(\Lambda, s p)$-open sets of $Y$ such that

$$
x \in F^{+}\left(V_{1}\right) \cap F^{-}\left(V_{2}\right) .
$$

By (2), $x \in F^{+}\left(V_{1}\right) \cap F^{-}\left(V_{2}\right) \subseteq\left[F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right)\right]_{(\Lambda, s p)}$. Then, there exists a $(\Lambda, s p)$-open set $U$ of $X$ such that

$$
x \in U \subseteq F^{+}\left(\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) \cap F^{-}\left(\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}\right) .
$$

Thus, $F(U) \subseteq\left[V_{1}^{(\Lambda, s p)}\right]_{(\Lambda, s p)}$ and $F(z) \cap\left[V_{2}^{(\Lambda, s p)}\right]_{(\Lambda, s p)} \neq \emptyset$ for every $z \in U$. This shows that $F$ is almost $(\Lambda, s p)$-continuous.
